### For the installer

# Servicing manual

Gas wall hung Boiler condensing Buderus 500 - 24/S Buderus 500 - 24/C Buderus 500 - 28/C

Please read thoroughly before attempting fault diagnosis

**C E** The boiler meets the basic requirements of the appropriate standards and directives. Conformity has been substantiated by the proper documents which - together with the declaration of conformity - are filed with the manufacturer.

### Subject to technical modifications!

Constant development efforts may result in minor deviations in illustrations, functional steps and technical data.

Updating the documentation

If you have suggestions for improvement or have found discrepancies, please do not hesitate to contact us.

We reserve the right to make technical modifications

### G. C. Aplliance No. :

Buderus 500-24/S	41-110-24
Buderus 500-24/C	41-110-04
Buderus 500-28/C	41-110-03

Other manuals available for this boiler are:

- user manual;
- installation and maintenance instructions;
- wall spacing frame instructions.

### box 2 Preface

These service instructions apply to: Buderus wall-mounted condensing gas boilers 500 - 24/S, 500 - 24/C and 500 - 28/C.

Model:	$C_{13(x)}, C_{33(x)}, C_{53(x)}, C_{73(x)}$
Туре:	GB/IE II <sub>2H3P</sub> 20 mbar, 37 mbar

Power rating: 230 VAC, 50 Hz, IP X4D

Fuse rating: 1.25 Ampere slow blow

The boiler unit consists of the following components:

- 500 Gas condensing boiler
- 28 Maximum output is 28 kW
- C Combination boiler (with integrated hot water supply)
- System boiler.

### Important general instructions for use

Only use the boiler in accordance with its designated use and the service instructions. Installation, maintenance and repair must be carried out by competent service engineers (e.g. CORGI registered). Only use the boiler in conjunction with the accessories and spare parts indicated in the installation, maintenance and service instructions. Other accessories and consumables may only be used if they are expressly provided for the designated use and if system performance and safety are not affected in any way.

The boiler is suitable for connection to fully pumped, <u>sealed</u> <u>water systems ONLY</u>. Adequate arrangements for completely draining the system by provision of draining valves must be provided in the installation pipework.

Pipework from the boiler is routed downwards as standard, but may be routed upwards behind the boiler using the wall spacing frame.

### Subject to technical modifications.

As a result of our policy of constant development, there may be small differences between illustrations, functional steps and technical data.

### **BENCHMARK' Log Book**

All Buderus gas fired boilers now include an installation, commissioning and service record log book. The details of the log book will be required in the event of any warranty work being requested.

Please complete the appropriate sections on completion of the installation and commissioning.

**REMEMBER**: Please hand the log book back to the user.

We reserve the right to make technical modifications

Servicing manual Gas condensing boiler Buderus 500-24/S, 500-24/C and 500-28/C • Issued 02/2006

### box 3 Regulations and directives

It is a requirement that all gas appliances are installed and serviced by a CORGI registered installer in accordance with the regulations. Failure to service appliances correctly could lead to prosecution. It is in your own interest, and that of safety, to ensure the law is complied with.

It is a requirement and in your own interest, and that of safety that this boiler must be serviced by a CORGI registered installer, in accordance with the relevant requirements of the current Gas Safety (Installation and Use) Regulations, The Building Regulations, current I.E.E. Wiring Regulations and the relevant British Standard Codes of Practise.

Detailed recommendations are contained in the following British Standard Codes of Practice:

BS. 5440:1	Flues (for gas appliances of rated input not exceeding 70 kW).
BS. 5440:2	Ventilation (for gas appliances of rated input not exceeding 70 kW).
BS. 5449	Forced circulation hot water systems.
BS. 5546	Installation of gas hot water supplies for domestic purposes (2nd. family Gases).
BS. 6798	Installation of gas fired hot water boilers of rated input not exceeding 60 kW.
BS. 6891	Low pressure installation pipes.
BS. 7593: 1992:	Code of practice for treatment of water in domestic hot water central heating systems.
IGE/UP/1b	Tightness testing and purging domestic sized gas installations.

### Health and & Safety Document No. 635.

### The Electricity at Work Regulations, 1989.

The manufacturer's notes must not be taken, in any way, as overriding statutory obligations.

The design and construction of the Buderus wall-mounted condensing gas boiler conforms to the basic specifications listed in the European directive governing gas-fired appliances 90/396/EEC, and with respect to EN 625, EN 483 and EN 677.

•	NOTE:

Observe the corresponding technical rules and the building supervisory and statutory regulations when installing and operating the system.

### WARNING!

Keep the burner-control unit housing CLOSED when working on water-bearing components.

#### NOTE: i

It is mandatory to clean and service the system once a year. This includes an inspection of the entire system to see if it is in full working order. Defects and faults must be eliminated immediately.

#### NOTE: i

i

When instructions aren't followed, warranty expires. NOTE:

Condensing boilers work more efficient if the CH flow/return temperature is as low as possible.

### **Timber Framed Buildings**

If the boiler is to be fitted in a timber framed building it should be fitted in accordance with the Institute of Gas Engineering document IGE/UP/7:1998 and BS 5440:1.

### **Bathroom Installations**

This appliance is rated IP X4D.

The boiler may be installed in any room or internal space, although particular attention is drawn to the requirements of the current IEE (BS.7671) Wiring Regulations and, in Scotland, the electrical provisions of the building regulations applicable in Scotland, with respect to the installation of the boiler in a room or internal space containing a bath or shower.

If the appliance is to be installed or serviced in a room containing a bath or shower then, providing water jets are not going to be used for cleaning purposes (as in communal baths/showers), the appliance can be installed or serviced in Zone 3, as detailed in BS.7671.

### **Compartment Installations**

A compartment used to enclose the boiler should be designed and constructed especially for this purpose. An existing cupboard or compartment may be used, provided that it is modified for the purpose.

In both cases, details of essential features of cupboard/ compartment design, including airing cupboard installation, are to conform to the following:

BS 6798 (No cupboard ventilation is required - see 'Air Supply' for details).

It is not necessary to have a purpose-provided air vent in the room or internal space in which the boiler is installed. Neither is it necessary to ventilate a cupboard or compartment in which the boiler is installed, due to the low surface temperatures of the boiler casing during operation; therefore the requirements of BS 6798, Clause 12, and BS 5440:2 may be disregarded.

The permanent clearances required are:

in front:	8 mm
below:	21 mm
right side:	8 mm
left side:	8 mm
above:	21 mm

The position selected for installation MUST allow adequate space for servicing in front of the boiler. See table below:

in front:	350 mm
below:	180 mm
right side:	8 mm
left side:	8 mm
above:	200 mm

In addition, sufficient space may be required to allow lifting access to the wall mounting bracket.

Wall-mounted condensing gas combi boilers must only be operated with Buderus purpose made gas systems, which are certified for this type of boiler.

We reserve the right to make technical modifications

### Safe handling of substances

No asbestos, mercury or CFCs are included in any part of the boiler and its manufacture.

### box 4 Hazard definitions and abbreviations

### Hazard definitions

### DANGER:

Indicates the presence of hazards that will cause severe personal injury, death or substantial property damage.

### WARNING:

Indicates the presence of hazards that can cause severe personal injury, death or substantial property damage.

### CAUTION:

Indicates presence of hazards that will or cause minor personal injury or property damage.

### NOTICE:

Indicates special instructions on installation, operation or maintenance that are important but not related to personal injury or property damage.

### Abbreviations

# Diagnosis

box 42		
step 1	Fit the casing to the boiler.	
step 2	Turn the mains switch on the DBA control panel of the boiler to position "0" (OFF), see box 43.	
step 3	Turn the mains switch on the DBA control panel of the boiler to position "1" (ON), see box 55.	
	The fault is now rectified.	
	Your Buderus 500 should be working now.	
We reserve	e the right to make technical modifications Buderus Ltd. • http://www.buderus-domestic	.co.uk

Servicing manual Gas condensing boiler Buderus 500-24/S, 500-24/C and 500-28/C  $\bullet$  Issued 02/2006

• Turn the mains switch on the boiler to position "**0**" (OFF, item 1).

• Turn the mains switch to "OFF".

- box 45
- Close the gas cock (item 1).
- box 47 Removal of casing

• Use a radiator key to turn the casing lock to "open", then remove casing.

#### box 48 Draining the system

• Take the boiler out of operation, see box 43, 44, 45, 46 or 47.

We reserve the right to make technical modifications

Buderus Ltd. • http://www.buderus-domestic.co.uk

Servicing manual Gas condensing boiler Buderus 500-24/S, 500-24/C and 500-28/C • Issued 02/2006

• Turn the operating switch on the boiler to position "1" (ON, item 1).

#### box 56

- Fill the heating system to a pressure of approximately 1.5 bar, then close the filling loop.
- Vent all the air vent points in the heating system, working from bottom to top, in order to allow all air in the heating system to escape.

#### box 57

- Loosen by two turns the vent screw (item 1) on the front of the pump.
- CAUTION! Water will also squirt out!

#### box 58

#### • Vent the pump.

#### ▲ CAUTION!

 Correct venting of the pump will help ensure that it runs for its specified service life.
 The sliding bearing, which is located behind the vent screw, is lubricated with heating system water.

- Once the heating system has been completely purged of air, check the pressure at the analogue pressure gauge. If the pressure is lower than 1.0 bar, the boiler should be topped up as described above.
- Close the water tap.

#### In the case of system boilers:

- Close the filling loop of the boiler, see box 50, item 2.
- Remove the hose.
- Fit the sealing cap to the filling and draining cock.

#### In the case of combination boilers:

- Close the filling loop.
- Remove the hose.
- Fit casing, see box 51.
- Configure target adjustments using the "Settings" menu on the DBA control panel of the boiler, see box 61

#### box 59 Initial startup

#### box 60

• Put the boiler into operation, see box 53, 54 or 55.

We reserve the right to make technical modifications

- Press the menu button (item 1) on the DBA control panel of the boiler.
- Configure the menu as required, see box 14.

#### box 62 Check/replace fuses (1)

# ANGER OF FATAL ACCIDENT

• Take the boiler out of operation, see box 43, 44 or 47.

#### box 63

- Remove the casing from the boiler, see box 47.
- Loosen the cap screw on the DBA control panel (item 1).
- Tip the DBA control panel forwards (item 2).

#### box 64

- Remove the rear section of the DBA control panel, see box 70.
- Remove the fuse from the fuse holder.
- Check the fuse with a multimeter. If the fuse possesses infinitely high electrical resistance, it is defective.
- Replace the defective fuse with a (new) 2.5 AT slow blow reserve fuse.

#### box 65

- Refit the DBA control panel, following the above procedure in reverse order.
- Refit the casing and place the boiler into operation, see box 51, 53, 54 or 55.

#### box 66 Check fan – activation 230V AC

# A DANGER OF FATAL ACCIDENT

#### CAUTION!

- To prevent damage, do not insert the measuring electrodes of the multimeter too far into the holes of the plug-and-socket connection.
- Remove the casing and place the boiler out of operation, see box 47, 43 or 44.

We reserve the right to make technical modifications

- Set the multimeter to VAC. Minimum value: 250 V AC.
- Disconnect the 230V AC plug (item 1) from the fan.
- Attach the multimeter to the two outer contacts (blue and brown) of the fan connection plug.
- Start system at full load, see box 54, 55 or 13.
- Check whether, with operating code 🔊 🔟 active, there is a voltage of 230 V AC at the two outer contacts (blue and brown) of the plug.

- Take the electrical system of the boiler out of operation, see box 43 and 44.
- Insert the fan connection plug.
- Refit the casing and place the boiler into operation, see box 51, 53, 54 or 55.

box 69 Check fan – power supply cable (230 V AC)

# DANGER OF FATAL ACCIDENT

- - To prevent damage, do not insert the measuring electrodes of the multimeter too far into the holes of the plug-and-socket connection.
- Take the boiler out of service and tip the DBA control panel forwards, see box 43, 44, 47 or 63.

• Loosen the six screws and remove the rear section.

#### box 71

- Disconnect the 230V AC plug (item 1) from the fan.
- Set multimeter to "measure resistance".
- Check the power supply cable of the fan for breaks. The electrical resistance measured at each individual wire must be approximately 0 Ω.
- Check the power supply cable of the fan for internal short circuits. The level of electrical resistance, measured between two wires chosen at random, must be infinitely high. See also box 287.

#### box 72

- Insert the fan connection plug.
- Refit the DBA control panel, following the above procedure in reverse order.
- Refit the casing and place the boiler into operation, see box 51, 53, 54 or 55.

We reserve the right to make technical modifications

- Pull out the tacho cable plug (item 1).
- Set multimeter to "measure resistance".
- Attach the multimeter.
- Check the tacho cable of the fan for breaks. The electrical resistance measured at each individual wire must be approximately 0  $\Omega$ .
- Check the tacho cable of the fan for internal short circuits. The level of electrical resistance, measured between two wires chosen at random, must be infinitely high.

- Connect the tacho cable plug.
- Refit the DBA control panel, following the above procedure in reverse order.
- Refit the casing and place the boiler into operation, see box 51, 53, 54 or 55.

#### due to electric shock

All work on gas pipework and gas-fitting components must be carried out by a company registered and authorised for this purpose.

NOTE:

Please observe the fitting instructions supplied with the fan.

 Take the boiler out of operation and close the gas tap, see box 43, 44, 46 or 47.

- Pull out the power supply plug of the gas valve (item 1).
- Loosen the union nut (item 2).
- Detach the air silencer tube (item 3).

- Pull out both fan plugs (item 2).
- Pull out the glow ignitor plug (item 3).
- Pull out the ionisation electrode plug (item 1).

We reserve the right to make technical modifications

- Twist (drawing 1) the fan in the direction of the arrow to remove (drawing 2).
- Check to see if the fan is soiled or wet.
- Check to see if the fan impeller has come loose at the motor spindle.

• Remove the gas valve (item 2).

box 81

• Remove the Venturi (item 1).

#### box 82

• Fit the Venturi to the new fan.

#### box 83

• Fit the gas valve to the new fan. When doing so, ensure that the gas injector (item 1) is correctly fitted.

#### box 84

- Fit the fan to the boiler. Remember to fit the new flat rubber sealing ring (supplied) when doing so.
- Fit the air silencer tube to the fan.
- Fit the gas supply pipe to the gas valve. Ensure when doing so that the flat rubber sealing ring is correctly fitted.
- Insert the power supply plug into the gas valve, then insert the power supply plug and tacho cable plug into the fan.
- Open the gas cock and place the electrical system of the boiler into operation, see box 59, 54 or 55.
- Carry out a gas-leak check. Check the tightness of all components that were loosened in the course of component removal. Use an authorised foam-type leak detection product for this purpose. If you detect a gas leak, refer to box 46, 43 or 44.
- Remedy the cause of the gas leak.
- Open the gas cock, place the electrical system of the boiler into operation and fit the casing, see box 59, 54, 55 or 51.

We reserve the right to make technical modifications

- Remove the fan, see box 76 to box 79.
- Check to see if the non return valve (item 5 and 6, if fitted) is soiled or defective.
- Loosen the upper nut (item 2).
- Loosen the two lower nuts (item 1).
- Turn the securing plate 180° counterclockwise (item 3).
- Remove the fan part (item 7).
- Bend the silicon seal (item 4).
- Remove the plastic valvehousing (item 5).
- Check the silicon valve (item 6) and replace when necessary.
- After checking, refit all components in reverse order. Make sure that the cam (item A) of the silicon valve is mounted in the correct manner (A).
- First tighten the upper nut (item 2), then tighten the lower two nuts (item 1).
- Refit all other components in reverse order, then put the boiler into service, see box 51, 54 or 55.

#### **Check the Venturi** box 86

- Take the boiler out of operation, see box 43, 44 or 47.
- Remove the air intake duct, see box 77.
- Remove the Venturi, see box 81, item 1.

- Check the article number of the Venturi against those listed in the table in box 5.
- Check to ensure that the correct Venturi has been fitted. This is done by comparing the article numbers listed against the number on the Venturi (item 1), see box 5.
- Check the Venturi for soiling.

#### box 88

- Refit the Venturi and fan by following the above procedure in reverse order.
- Refit the air silencer tube.
- Refit the casing and place the boiler into operation, see box 51, 53, 54 or 55.

Check the pump – mechanical restrictions box 89

- Remove casing, see box 47.
- Remove the vent screw on the front of the pump, see box 57.

#### **CAUTION!**

Note that water will squirt out when the vent screw is removed. Have a bucket and a supply of dry cloths to hand.

#### box 90

- Put the electrical system of the boiler into operation, see box 54 and 55.
- Check to see if the pump is running. The pump may become mechanically blocked if the heating system has been out of use for an extended period.
- Insert a screwdriver and attempt to make the pump turn. Use the screwdriver to turn the fan wheel in the direction of rotation shown on the identification plate of the pump.
- Refit the vent screw to the pump.
- Fit casing, see box 51.

We reserve the right to make technical modifications

- Set the multimeter to "measure AC voltage". Minimum measuring range: 250V AC.
- Put the boiler into operation, see box 54 and 55.
- Carry out a multimeter check to verify whether 230V AC is present at both outer contacts (L and N) of the power supply plug of the pump during locking fault code 21.

#### box 94

- Insert the power supply plug of the pump.
- Fit casing, see box 51.

box 95 Check the pump – power supply cable

# A DANGER OF FATAL ACCIDENT

- Take the boiler out of serve and tip the DBA control panel forwards, see box 43, 44, 47 or 63.
- Loosen the six screws and remove the rear section, see box 70.
- Remove the power supply plug of the pump, see box 92.

box 96

- Check the power supply cable of the pump for breaks. The electrical resistance measured at each individual wire must be approximately 0 Ω.
- Check the power supply cable of the pump for internal short circuits. The level of electrical resistance, measured between two wires chosen at random, must be infinitely high.
- Fit the power supply plug of the pump, fit the DBA control panel and place the boiler into operation, see box 53, 54 or 55.

#### box 97 Check the pump – soiling

• Take the boiler out of operation and drain the heating system, see box 43, 44, 47, 45, 49 or 50.

We reserve the right to make technical modifications

- Loosen the four Allen screws on the pump.
- Remove the top section of the pump.

#### box 99

• Clean the pump impeller wheel.

#### box 100

- Refit the top section of the pump.
- Fill and vent the heating system, see box 52 to 58.
- Fit casing, see box 51.

#### box 101 Replace the pump

A DANGER OF FATAL ACCIDENT due to electric shock

- Take the boiler out of operation and drain the heating system, see box 43, 44, 47, 45, 49 or 50.
- Remove the power supply plug of the pump, see box 92.

#### box 102

- Loosen the union nuts (item 1) at the top and side of the pump.
- Remove the pump.

#### box 103

#### ∧ CAUTION!

 $\bigtriangleup$  Fit new flat sealing rings when installing the new pump.

- Install the new pump.
- Insert the power supply plug of the pump, fill and vent the heating system of air and put the boiler into operation, see box 57 to 60.
- Fit casing, see box 51.

box 104 Check the flow, safety and DHW temp. sensors (applies to external cylinder only)

- Put the boiler into operation, see box 54 or 55.
- Open the hot water tap and wait for the boiler to start up, then gradually close the hot water tap to bring the CH flow temperature to over 80 °C.
- Take the boiler out of operation and remove the casing, see box 43, 44 or 47.

We reserve the right to make technical modifications

• Pull out the plug of the safety sensor.

- Set multimeter to "measure resistance".
- Measure the resistance of the safety sensor.

#### box 107

• Pull out the plug of the flow NTC sensor.

box 108

- Set multimeter to "measure resistance".
- Measure the resistance of the flow NTC sensor.

#### box 109

- Measure the electrical resistance of the flow NTC sensor and safety sensor.
- Measure the electrical resistance of the flow NTC sensor and check the earth (ground) connection of the safety sensor. This must be infinitely high. The measured resistance of the flow NTC sensor is virtually identical to that of the safety sensor.

We reserve the right to make technical modifications

#### box 110

- Use a digital contact-type thermometer to measure the temperature in the vicinity of the corresponding sensor.
- Compare the resistance readings with the values listed in box 111.
- Replace the corresponding sensor if the reading fluctuates by more than 10% with respect to the reference value (e.g. infinitely high resistance in the event of a line break or resistance of 0  $\Omega$  in the case of a short circuit).
- Reinsert the plug.
- Refit the casing and place the boiler into operation, see box 51, 53, 54 or 55.

#### box 111

Resistance readings (approximate values) for the sensor

Temperature in °C	$\frac{\text{Resistance in}}{\Omega}$	Temperature in °C	$\frac{\text{Resistance in}}{\Omega}$
0	29,490		
5	23,462	55	3,271
10	18,787	60	2,760
15	15,136	65	2,339
20	12,268	70	1,990
25	10,000	75	1,700
30	8,197	80	1,458
35	6,754	85	1,255
40	5,594	90	1,084
45	4,656	95	940
50	3,893	100	817

# box 112 Check the flow, safety and DHW temperature

#### DANGER OF FATAL ACCIDENT due to electric shock

### **CAUTION!**

- To prevent damage, do not insert the measuring electrodes of the multimeter too far into the holes of the plug-and-socket connection.
- Take the boiler out of service and tip the DBA control panel forwards, see box 43, 44, 47 or 63.
- Loosen the six screws and remove the rear section, see box 70.
- Pull out the plugs of the flow NTC sensor and safety sensor, see box 105.

Key to terms: 1) Flow NTC sensor 2) Safety sensor

- Set multimeter to "measure resistance".
- Check the cables of the flow NTC sensor and safety sensor for breaks. The electrical resistance measured at each individual wire must be approximately 0  $\Omega$ .
- Check the cables of the flow NTC sensor and safety sensor for internal short circuits. The level of electrical resistance, measured between two wires, must be infinitely high.
- Measure the electrical resistance of the flow NTC sensor and check the earth (ground) connection of the safety sensor. This must be infinitely high.

We reserve the right to make technical modifications

- Detach the cables of the DHW temperature sensor (item 3 and 4) from the DBA control panel.
- Measure the resistance of the cable of the DHW temperature sensor and check it for short circuits and breaks. See box 112.
- Fit the cables of the DHW temperature sensor to the DBA control panel (item 3 and 4).

- Insert the cables of the corresponding DHW temperature or outside air-temperature sensor.
- Fit the DBA control panel and place the boiler into operation, see box 54, 55 or 51.

box 116 Replace the flow NTC sensor and/or safety sensor

• Take the boiler out of operation, drain the heating system and pull out the plug of the corresponding sensor, see box 43, 44, 47, 45, 47, 49 or 50.

box 117

#### CAUTION!

- Note that water will squirt out when the sensor is removed. Have a bucket and a supply of dry cloths to hand.
- Pull out the plug of the safety sensor (item 1).
- Detach the stop spring of the safety sensor by pulling in the direction of the arrow (item 2).
- Remove the safety sensor (item 3).

#### box 118

#### CAUTION!

Note that water will squirt out when the sensor is removed. Have a bucket and a supply of dry cloths to hand.

- Detach the stop spring of the flow NTC sensor by pulling in the direction of the arrow.
- Remove the flow NTC sensor.

#### box 11

- Fit the corresponding new sensor.
- Fill the heating system, vent it of air and place the boiler into operation, see box 52 to 58.

We reserve the right to make technical modifications

#### Remove both plugs of the flue-gas STL.

#### box 122

- Set multimeter to "measure resistance".
- Check the electrical resistance of the flue-gas STL.

#### box 123

- Check the temperature of the flue gas at the test point on the flue pipe.
- Compare the flue-gas temperature reading with the measured electrical resistance, see box 124.

#### box 124

Flue-gas STL			
Temperature	Status	Resistance in $\Omega$	
≤ 105 °C	closed	0	
>105 °C	open	infinitely high	

#### box 125

• Insert both plugs at the flue-gas STL and fit the cover on the test point of the flue pipe. Put the boiler into operation, see box 51, 54 or 55.

#### box 126 Check the flue-gas STL - cable

# DANGER OF FATAL ACCIDENT

- Take the boiler out of service and tip the DBA control panel forwards, see box 43, 44, 47 or 63.
- Loosen the six screws and remove the rear section, see box 70.
- Remove both plugs of the flue-gas STL, see box 121.

# JP4

- Set multimeter to "measure resistance".
- Check the cables of the flue-gas STL for breaks.
- The electrical resistance measured at each individual wire must be approximately 0 Ω.
- Check the cables of the flue-gas STL for internal short circuits. The level of electrical resistance, measured between two wires chosen at random, must be infinitely high.

#### box 128

• Insert both plugs at the flue-gas STL, fit the DBA control panel, attach the casing and place the boiler into operation, see box 51, 54 or 55.

#### box 129 Replace the flue-gas STL

- Take the boiler out of operation, see box 43, 44 or 47.
- Remove both plugs of the flue-gas STL, see box 121.
- Twist the flue-gas STL anticlockwise to remove.
- Fit the new flue-gas STL. Use a new seal when doing so.
- Insert both plugs at the flue-gas STL and place the boiler into operation, see box 51, 54 or 55.

We reserve the right to make technical modifications

#### Buderus Ltd. • http://www.buderus-domestic.co.uk

Servicing manual Gas condensing boiler Buderus 500-24/S, 500-24/C and 500-28/C • Issued 02/2006

We reserve the right to make technical modifications

- Set multimeter to "measure resistance".
- Check the mains cable of the glow ignitor for breaks. The electrical resistance measured at each individual wire must be approximately 0 Ω.
- Check the mains cable of the glow ignitor for internal short circuits. The level of electrical resistance, measured between any two wires, must be infinitely high.

- Connect the plug of the glow ignitor.
- Fit the DBA control panel and place the boiler into operation, see box 51, 54 or 55.

#### box 140 Replace the glow ignitor

# DANGER OF FATAL ACCIDENT

- Take the boiler out of operation, see box 43, 44 or 47.
- Remove the plug of the glow ignitor, see box 131.

#### box 141

Servicing manual Gas condensing boiler Buderus 500-24/S, 500-24/C and 500-28/C • Issued 02/2006

#### box 142

#### ▲ CAUTION!

The filament of the glow ignitor consists of sintered material and is highly breakable.

- Fit a new glow ignitor.
- Connect the plug of the glow ignitor.
- Put the boiler into operation, see box 51, 54 or 55.

#### box 143 Measure the ionisation current

• Take the boiler out of operation, see box 43, 44 or 47.

#### box 144

• Pull out the ionisation electrode plug (item 1).

box 145

• Use a multimeter that is specially designed to measure the ionisation current.

We reserve the right to make technical modifications

- Set the multimeter to "measure direct current". Measuring range: Microamperes [µA].
- Connect the multimeter in series the ionisation circuit.
- Put the boiler into service mode, see box 54, 55 or 13.
- Check to see if the ionisation current, during service mode, operating code 
   L □ , > 5 μA (micro amperes) and, with operating code 
   H<sub>1</sub> , > 25 μA. The value is 0 (zero), or between 1.3 and 50 μA.

#### box 147

- Take the boiler out of operation, see box 43 or 44.
- Detach the multimeter.
- Connect the plug of the ionisation electrode.
- Turn the operating switch on the boiler to position "**0**", see box 55.
- Put the boiler into operation, see box 51, 54 or 55.

#### box 148 Check the ionisation electrode - short circuits

- Take the boiler out of operation, see box 43, 44 or 47.
- Loosen the plug-in connection of the ionisation electrode, see box 144.

#### box 149

- Set multimeter to "measure resistance".
- Take a reading at the electrode to check whether there is a possible short circuit between the ionisation electrode and earth (ground). The electrical resistance between the ionisation electrode and earth (ground) must be infinitely high.

We reserve the right to make technical modifications

#### box 150

- Connect the plug of the ionisation electrode.
- Put the boiler into operation, see box 51, 54 or 55.

box 151 Check the ionisation electrode – cable

# A DANGER OF FATAL ACCIDENT

- Take the boiler out of service and tip the DBA control panel forwards, see box 43, 44, 47 or 63.
- Loosen the six screws and remove the rear section, see box 70.
- Remove the plug of the ionisation electrode, see box 144.

- Set the multimeter to "measure resistance".
- Take a reading at the ionisation electrode to check whether there is a possible break in the cable of the electrode. The electrical resistance of the cable must be approximately 0 Ω.

#### box 153

• Take an earth (ground) reading check whether there is a possible short circuit between the cable of the ionisation electrode and earth (ground). The electrical resistance between the ionisation electrode cable and earth (ground) must be infinitely high.

#### box 154

- Connect the plug of the ionisation electrode.
- Refit the DBA control panel, by following the above procedure in reverse order, and place the boiler into operation, see box 51, 54 or 55.

box 155 Check and replace the ionisation electrode

- Take the boiler out of operation, see box 43, 44 or 47.
- Remove the plug of the ionisation electrode, see box 144.

#### box 156

box 157

- Set multimeter to "measure resistance".
- Take a reading at the ionisation electrode to check whether there is a possible break in the electrode cable. The electrical resistance of the ionisation electrode cable must be approximately 0 Ω.

 Check the ionisation electrode for signs of wear (item 2), damage (item 3) or soiling (item 4).

#### ox 159

- Replace the ionisation electrode if required.
- Fit the ionisation electrode.
- Connect the plug of the ionisation electrode.
- Put the boiler into operation, see box 51, 54 or 55.

box 160 Check the ionisation circuit – earth (ground) lead

 Check to ensure that the earth (ground) lead of the ionisation circuit (item 1) has been correctly fitted.

We reserve the right to make technical modifications

box 168

• Remove the plug from the gas valve (item 1).

#### box 169

- Set multimeter to "measure resistance".
- Check the power supply cable of the gas valve for breaks. The electrical resistance measured at each individual wire must be approximately 0 Ω.
- Check the power supply cable of the gas valve for internal short circuits. The level of electrical resistance, measured between two wires, must be infinitely high.

#### box 170

- Insert the gas valve plug.
- Fit the DBA control panel and place the boiler into operation, see box 51, 54 or 55.

box 171 Check the gas valve – internal electrical resistance

- Take the boiler out of operation, see box 43, 44 or 47.
- Remove the power supply plug of the gas valve, see box 168.

We reserve the right to make technical modifications

- Set multimeter to "measure resistance".
- Take a reading at the coils to check the internal electrical resistance of the two gas valve coils. The electrical resistance between the middle and lower contact must be approx.  $70 110 \Omega$  (item 1). The electrical resistance between the middle and upper contact must be approx.  $180 250 \Omega$  (item 2).

- Fit the power supply plug to the gas valve.
- Put the boiler into operation, see box 51, 54 or 55.

#### box 174 Replace the gas valve

#### DANGER OF FATAL ACCIDENT!

All work on gas pipework and gas-fitting components must be carried out by a company registered and authorised for this purpose.

- Take the boiler out of operation and close the gas tap, see box 43, 44, 46 or 47.
- Remove the fan, see box 77, 78, 79 or 80.

#### box 175

• Pull the gas injector (item 1) out of the gas valve.

#### box 176

- Fit the gas injector to the new gas valve.
- Fit the new gas valve to the fan.
- Fit the fan to the boiler, insert the air silencer tube into the fan, fit the gas supply pipe to the gas valve and insert the plugs into the fan and gas valve.
- Fit the air silencer tube to the fan.

#### CAUTION!

When attaching the gas supply pipe to the gas valve, ensure that the flat rubber seal is fitted correctly between the gas supply pipe and gas valve.

- Fit the gas supply pipe to the gas valve.
- Insert the power supply plug into the gas valve, then insert the power supply plug and tacho cable plug into the fan.
- Open the gas cock and place the boiler into full-load operation, see box 59, 54, 55 or 13.
- Carry out a gas-leak check. Check the tightness of all components that were loosened during removal of the gas valve. Use an authorised foam-type leak detection product for this purpose.
- Remedy the cause of the gas leak.
- Put the boiler into operation, see box 51, 54 or 55.

# box 177 Check the ON/OFF or modulating control function

- Take the boiler out of service and tip the DBA control panel forwards, see box 43, 44, 47 or 63.
- Loosen the six screws and remove the rear section, see box 70.

#### box 178

We reserve the right to make technical modifications

- Put the boiler into full-load operation, see box 54, 55 or 61. If the boiler goes into heating mode within approx. 3 minutes [-H], the cause of the fault lies outside the boiler.
- Take the boiler out of operation, see box 43 or 44.
- Remove the bridge connection.
- Connect the ON/OFF or modulating control element to the hoiler
- Put the boiler into operation, see box 51, 54 or 55.

box 180 Adjust the output flow rate (applies to

#### **CAUTION!**

As the water pressure and pipework resistance in the plumbing system can vary widely with each situation, it is important to adjust correctly the DHW flow rate at the boiler. Take a DHW flow rate reading, see box 12.

Adjust the DHW flow rate at the flow regulator for hot water. To check the DHW flow rate press and hold the down " arrow and read off the display in ltrs/m.

- To increase the DHW flow rate: turn the flow regulator in direction "+".
- To reduce the DHW flow rate: turn the flow regulator in direction "-".
- Adjust the flow rate of hot water at one of taps where the user is likely to require hot water at an ideal temperature.
- Factory default setting: see factory settings in the installation instruction.

This assumes a cold water input temperature of 10 °C.

box 181 Check the internal 3-way valve – movement of

• Take the boiler out of operation, see box 43, 44 or 47.

box 182

#### **DANGER OF DAMAGE TO THE SYSTEM!** Before removing the servomotor, check to see if the

- 3-way valve is in its "heating mode" position, and wait for the boiler display code 🔿 🔲 H to appear. This prevents sudden pressure surges occurring in the heating circuit while the removal operation is taking place, and the resultant accidental opening of the pressure relief valve.
- Remove the stop spring (item 1).
- Remove the servomotor.

# box 183 Ć

- Put the boiler into operation, see box 54 and 55.
- Use the "Settings" menu on the boiler DBA control panel to adjust the temperature to 60 °C, see box 14 or 18.
- Open a hot water tap.
- Check to see if the servomotor of the internal 3-way valve, during operating code 🔕 🔟 revolution.
- Close the hot water tap.
- Check to see if the servomotor runs back again.

We reserve the right to make technical modifications

Buderus Ltd. • http://www.buderus-domestic.co.uk

58

- Fit the servomotor to the 3-way valve.
- Insert the stop spring.
- Adjust the DBA control panel, see box 61.
- Fit casing, see box 51.

#### box 185 Check the internal 3-way valve – activation

#### CAUTION!

- To prevent damage, do not insert the measuring electrodes of the multimeter too far into the holes of the plug-and-socket connection.
- Take the boiler out of operation, see box 43, 44 or 47.

#### box 186

• Pull out the power supply plug of the servomotor.

#### box 187

• Put the boiler into operation, see box 54 and 55.

#### box 188

- Set the multimeter to "measure AC voltage". Minimum measuring range: 40V AC.
- Use the "Settings" menu on the boiler DBA control panel to adjust the temperature to 60 °C, see box 14 or 18.
- Open a hot water tap.
- Check to see if, during operating code 🔊 🔟 at plug-in contacts "1" and "3", 24 V AC is detected between plug-in contacts "1" and "2".
- Close the hot water tap.
- Check to see if, during operating code 
   IIH, 24 V AC is detected at plug-in contacts "1" and "2".

#### box 189

- Insert the power supply plug of the 3-way valve.
- Put the boiler into operation, see box 51 or 61.

box 190 Internal 3-way valve – replace the servomotor

- Take the boiler out of operation, see box 43, 44 or 47.
- Remove the power supply plug of the servomotor, see box 186.
- Remove the servomotor, see box 182.
- Fit the new servomotor by following the above procedure in reverse order.
- Put the boiler into operation, see box 51, 54 or 55.

box 191 Check the internal 3-way valve – power supply cable

DANGER OF FATAL ACCIDENT

#### CAUTION!

To prevent damage, do not insert the measuring electrodes of the multimeter too far into the holes of the plug-and-socket connection.

- Take the boiler out of operation and remove the DBA control panel, see box 43, 44, 47, 63 or 70.
- Remove the power supply plug of the servomotor of the 3-way valve, see box 186.

- Set multimeter to "measure resistance".
- Check the power supply cable of the 3-way valve for breaks. The electrical resistance measured at each individual wire must be approximately 0 Ω.

We reserve the right to make technical modifications

• Check the power supply cable of the 3-way valve for internal short circuits. The level of electrical resistance, measured between two wires chosen at random, must be infinitely high.

#### box 194

• Insert the power supply plug of the 3-way valve, fit the DBA control panel and place the boiler into operation, see box 51, 54 or 55.

box 195 Check the internal 3-way valve – drive mechanism

- Take the boiler out of operation, see box 43, 44 or 47.
- Remove the servomotor of the 3-way valve, see box 182.

• Check to ensure that the drive mechanism of the 3-way valve is running smoothly. This is done by gradually pushing the spring fully home by hand and allowing the spring to return gradually to its home position.

#### box 197

- Refit the servomotor, following the above procedure in reverse order.
- Put the boiler into operation, see box 51, 54 or 55.

box 198 Replace the internal 3-way valve – drive mechanism

- Take the boiler out of operation and drain the heating system, see box 48 to 51.
- Remove the servomotor of the 3-way valve, see box 182.

#### box 199

• Remove the stop spring (item 1) by pulling it in the direction of the arrow.

box 200

- Remove the drive mechanism (item 1) of the 3-way valve.
   CAUTION!
  - Note that water will squirt out when the drive mechanism is removed. Have a bucket and a supply of dry cloths to hand.

We reserve the right to make technical modifications

• Fit the new drive mechanism on the internal 3-way valve. Ensure that the flat side faces upwards.

#### box 202

- Connect the servomotor of the 3-way valve by following the above procedure in reverse order.
- Fill the heating system, vent it of air and place the boiler into operation, see box 52 to 58.

#### box 203 Replace the internal 3-way valve

• Take the boiler out of operation and drain the heating system, see box 48 to 51.

box 204

- Pull out the flow NTC sensor plug (item 2).
- Pull the main switch cable out of the nut (item 3).

Servicing manual Gas condensing boiler Buderus 500-24/S, 500-24/C and 500-28/C • Issued 02/2006

box 205

• Remove the stop spring and 3-way valve-motor.

- Pull the plug (item 1) out of the pump.
- Loosen the four screws (item 3) on the pump.
- Remove the return pipe with spring (item 4).
- Remove the pipe to the expansion vessel with spring (item 5).
- Pull out the pump (item 2).

We reserve the right to make technical modifications

Buderus Ltd. • http://www.buderus-domestic.co.uk

61

• Remove all pipes beneath the boiler.

#### CAUTION!

- Note that water will squirt out when the internal 3-way valve is removed. Have a bucket and a supply of dry cloths to hand.
- Loosen the gas pipe at the gas valve.
- Remove the two screws (item 1).
- Remove the complete hydraulic assembly.
- Remove the four M8 nuts (item 2).
- Remove the five screws (item 3).
- Remove the plastic block (H3).

box 208

- Loosen the screw in the plastic block (item 2).
- Remove the pressure relief valve (item 1), see box 276 or 277.
- Remove the drive mechanism on the internal 3-way valve, see box 200.

#### CAUTION!

▲ Note that water will squirt out when the internal 3-way valve is removed. Have a bucket and a supply of dry cloths to hand.

box 209

• Replace the housing of the 3-way valve.

#### box 21

- Refit all components, following the above procedure in reverse order.
- Fill the heating system, vent it of air and place the boiler into operation, see box 52 to 58.

#### box 211 Check the Buderus 24V AC external 3-way valve – movement of the servomotor

- Put the boiler into operation, see box 54 and 55.
- Adjust the hot water in the "Settings" menu on the DBA control panel of the boiler to 60 °C, see box 61.
- Open a hot water tap.
- Check to see if the servomotor of the Buderus 24V AC external 3-way valve, during the operating code 
   II rotates from the setting for heating mode (position "1") to the position for hot water mode (position "2").
- Close the hot water tap.
- Check to see if the servomotor runs back again.
- Adjust the hot water in the "Settings" menu on the DBA control panel of the boiler, see box 61.

We reserve the right to make technical modifications

2

We reserve the right to make technical modifications

**CAUTION!** 

box 220 Check the Buderus 24V AC external

3-way valve - power supply cable

To prevent damage, do not insert the measuring

# box 224 Replace the Buderus 24V AC external 3-way

- Take the boiler out of operation and drain the heating system, see box 48 to 51.
- Remove the servomotor of the Buderus 24V AC external 3-way valve, see box 213 or 218.

 Remove the drive mechanism of the Buderus 24V AC external 3-way valve using the wrench supplied with the drive mechanism.

```
Note that water will squirt out when the drive
mechanism is removed.
Have a bucket and a supply of dry cloths to hand.
```

- Fit the new drive mechanism to the Buderus 24V AC external 3-way valve.
- Connect the servomotor of the Buderus 24V AC external 3-way valve by following the above procedure in reverse
- Fill the heating system, vent it of air and place the boiler into operation, see box 52 to 58.

- Use the letters marked on the 3-way valve to check whether the Buderus 24V AC external 3-way valve is
  - A = flow of storage-type water heater
  - **AB**= boiler flow

We reserve the right to make technical modifications

Plug-in contacts on DBA control panel	Purpose	Plug-in contacts of Buderus 24V AC external 3- way valve
5	24V AC	2
6	0V AC	3
7	_\	6

- Take the boiler out of operation and remove the DBA control panel, see box 43, 44, 47, 63 or 70.
- Put the boiler into operation, see box 54 and 55.
- Open hot water tap.
- Adjust the hot water in the "Settings" menu on the DBA control panel of the boiler to 60 °C, see box 61 and box 14.
- Set the multimeter to "measure AC voltage". Minimum measuring range: 40V AC.

Plug-and-socket connection DBA control panel conn.

7

6

5

6			
3			
2			

- Check whether, with operating code 🔕 🔟 active, there is a voltage of 24 V AC at the plug-in contacts item 6 and item 7.
- Close the hot water tap.
- Check whether, with operating code 🔊 🔲 H active, there is a voltage of 24 V AC at the plug-in contacts item 5 and item 6.

box 229

• Fit the DBA control panel and place the boiler into operation, see box 51, 54 or 55.

# box 230 Measure the gas input pressure – static and dynamic

DANGER OF FATAL ACCIDENT!

All work on gas supply pipes and gas-fitting components must be carried out by a company registered and authorised for this purpose.

- Take the boiler out of operation and close the gas tap, see box 43, 44, 46 or 47.
- Open some of the radiator valves.

#### box 231

#### CAUTION!

The pressure gauge should be accurate to 2 decimal places (X.00).

• Reset the digital pressure gauge to zero.

#### CAUTION!

Throughout the measuring operation, keep the pressure gauge in the same position (horizontal or vertical) in which it was reset to zero.

- Loosen by two turns the screw on the gas connection pressure measuring nipple (item 1).
- Fit the pressure gauge to the gas connection pressure measurement nipple (item 2).

We reserve the right to make technical modifications

- Open the gas tap, see box 59.
- Put all other gas-fired devices (e.g. gas ovens and stoves, etc.) out of use.
- Check to see if static gas input pressure does not rise slowly for 2 minutes.
- Run all other gas-fired appliances (e.g. gas ovens and stoves, etc.) at full capacity, but do not operate the boiler.
- The static gas input pressure must be: for **natural gas** minimum 20 mbar and for **propane** minimum 37 mbar.
- Open the gas cock and place the boiler into service mode, see box 59, 54, 55 or 13.
- Press the service button "
   –" twice.
- Capacity during service mode is at "A" H<sub>1</sub> = 100 % (max. heating capacity).
- Wait for 1 minute, until the boiler starts at full load.
- Measure the working gas pressure at the appliance.
- Measure the difference between the static and working gas input pressure.
   The working pressure may be: for natural gas minimum 17 mbar and
- for propane minimum 30 mbar.Take the boiler out of operation and close the gas tap, see
- box 43, 44 or 46.
- Remove the pressure gauge.
- Tighten the screw on the gas connection pressure measurement nipple.
- Open the gas tap, see box 59.
- Use a detection product to check the gas connection pressure measurement nipple for leaks. Use an authorised foam-type leak detection product for this purpose.
- Fit the casing and place the boiler into operation, see box 51, 54 or 55.

box 233 Measure and adjust the gas/air ratio

#### DANGER OF FATAL ACCIDENT!

All work on gas pipework and gas-fitting components must be carried out by a company registered and authorised for this purpose.

- Take the boiler out of operation and close the gas tap, see box 43, 44, 46 or 47.
- Open some of the radiator valves.

box 234

Reset the digital pressure gauge to zero.

#### ▲ CAUTION!

Throughout the measuring operation, keep the pressure gauge in the same position (horizontal or vertical) in which it was reset to zero.

- Loosen by two turns the screw on the burner pressure measurement nipple (item 1).
- Connect the pressure gauge to the burner pressure measurement nipple (item 2).

#### box 235

- Open the gas cock and place the boiler into service mode, see box 59, 54, 55 or 13.
- Press the service button "
   –" once.
- Capacity during service mode is at (A) L = 25% (max. heating circuit capacity).
- Wait a short time for the boiler to be adjusted downwards.

#### box 236

A = correct; B = false; C = turn anticlockwise;D = turn clockwise

 Check the gas/air ratio during service mode operation. The differential pressure (p<sub>gas</sub> - p<sub>air</sub>) must be -5 Pa (±5 Pa) (as indicated by the measuring device: -10 to 0 Pa).

We reserve the right to make technical modifications

Use the adjustment screw to readjust the gas/air ration necessary (item 1).

#### NOTE:

The adjustment screw (4mm Allen screw) is located behind the screw-on cover.

#### box 238

- Take the boiler out of operation and close the gas tap, see box 43, 44 or 46.
- Remove the pressure gauge.
- Tighten the screw on the burner pressure measurement nipple.
- Open the gas cock and place the boiler into full-load operation, see box 59, 54, 55 and 13.
- Wait for the boiler to start.
- Use a detection product to check the burner pressure measurement nipple for leaks. Use an authorised foam-type leak detection product for this purpose.
- Take the boiler out of operation, see box 43 or 44.
- Fit the casing and place the boiler into operation, see box 51, 54 or 55.

#### box 239 Vent the gas flow pipe.

#### DANGER OF FATAL ACCIDENT!

All work on gas supply pipes and gas-fitting components must be carried out by a company registered and authorised for this purpose.

• Take the boiler out of operation and close the gas tap, see box 43, 44, 46 or 47.

box 240

- Loosen by two turns the screw on the gas connection pressure measuring nipple (item 1).
- Connect a long hose (item 2) to the gas connection pressure measurement nipple and then run this hose out of the building.

#### box 241

- Leave the gas cock open until no further air escapes from the hose, see box 59.
- Close the gas cock, see box 46.
- Remove the hose from the gas connection pressure measurement nipple.
- Tighten the screw on the gas connection pressure measurement nipple.
- Open the gas tap, see box 59.
- Use a detection product to check the gas connection pressure measurement nipple for leaks. Use an authorised foam-type leak detection product for this purpose.
- Fit the casing and place the boiler into operation, see box 51, 54 or 55.

#### box 242 Replace the automatic air vent

• Take the boiler out of operation and drain the heating system, see box 48 to 50.

We reserve the right to make technical modifications

• Twist the automatic air vent in the direction of the arrow to remove.

#### box 244

/4\

- Fit the new automatic air vent by following the above procedure in reverse order.
- Fill the heating system, vent it of air and place the boiler into operation, see box 52 to 58.

#### box 245 Replace the burner

# DANGER OF FATAL ACCIDENT due to electric shock

All work on gas supply pipes and gas-fitting components must be carried out by a company registered and authorised for this purpose.

- Take the boiler out of operation and close the gas tap, see box 43, 44, 46 or 47.
- Remove the power supply plug of the glow ignitor, see box 131.
- Remove the plug of the ionisation electrode, see box 144.
- Remove the power supply plug of the gas valve, union nut and air silencer tube, see box 77.

box 246

We reserve the right to make technical modifications

box 247

box 248

• Remove the gas/air unit along with the burner.

box 249

• Fit the new burner to the gas/air unit. Note that a new seal must be fitted between the burner and gas/air unit.

#### box 251

• Remove the heat exchanger-gas/air seal.

#### box 252

- Check the heat exchanger-gas/air seal for signs of ageing.
- Replace the heat exchanger-gas/air seal if required.
- Refit all components, following the above procedure in reverse order.
- Open the gas cock and place the boiler into full-load operation, see box 59, 54, 55 and 13.
- Carry out a gas-leak check. Check the tightness of all components that were loosened in the course of removal of the burner. Use an authorised foam-type leak detection product for this purpose.
- Remedy the cause of the gas leak.
- Open the gas cock and place the boiler into operation, see box 59, 54, 55 or 51.

#### box 253 Replace the sight glass

• Take the boiler out of operation, see box 43, 44 or 47.

#### box <u>254</u>

Servicing manual Gas condensing boiler Buderus 500-24/S, 500-24/C and 500-28/C • Issued 02/2006

- box 255
- Install the new sight glass. Use a new seal when doing so.
- Put the boiler into operation, see box 51, 54 or 55.

box 256 Replace/clean condensate trap and syphon

• Take the boiler out of operation, see box 43, 44 or 47.

#### box 257

• Remove the condensate trap (item 1) and syphon (item 2).

#### box 258

- Clean the condensate trap and syphon.
- Fit the new or cleaned syphon.
- Put the boiler into operation, see box 51, 54 or 55.

We reserve the right to make technical modifications

0

1 • Remove the stop spring on the top left-hand side of the heat exchanger by turning it towards the arrow.

box 261

ſ

We reserve the right to make technical modifications

• Open the four clip fastenings(item 1).

air or with TAB2.

• Clean the heat exchanger with a brush and compressed

In the event of serious restriction, continue with box 261.

Buderus Ltd. • http://www.buderus-domestic.co.uk

Servicing manual Gas condensing boiler Buderus 500-24/S, 500-24/C and 500-28/C • Issued 02/2006

Servicing manual Gas condensing boiler Buderus 500-24/S, 500-24/C and 500-28/C • Issued 02/2006

• Fill the heating system, vent it of air, open the gas tap and place the boiler into operation, see box 59 or 52 to 58.

box 269 Replace plate heat exchanger

- Take the boiler out of operation, see box 43, 44 or 47.
- Close the cold water tap.
- Drain the heating system, see box 48 to 51.
- Open hot water tap.

#### box 270

• Remove condensate trap.

box 271

We reserve the right to make technical modifications

box <u>272</u>

• Remove both screws from the plate heat exchanger.

#### box 27

• Remove the plate heat exchanger.

- Fit new plate heat exchanger.
- Renew the four O-rings if necessary.
- Refit the plate heat exchanger and secure with the two screws.
- Open the cold water service valve.
- Open the hot water tap in order to clean the new plate heat exchanger (inside).
- Close the hot water tap.
- Fill the heating system, see box 52.
- Fit the casing and place the boiler into operation, see box 51, 54 or 55.

#### box 275 Replace the pressure relief valve

• Take the boiler out of operation and drain the heating system, see box 48 to 50.

- Remove the stop spring (item 2) of the pressure relief valve.
- Remove the pressure relief valve (item 1) in the direction of the arrow.

We reserve the right to make technical modifications

#### box 278

- Fit the new pressure relief valve and all other components by following the above procedure in reverse.
- Fill the heating system, vent it of air and place the boiler into operation, see box 52 to 58.

#### box 279 Replace the turbine flowmeter

Remove the stop spring.

box 280

• Use a screwdriver to lever out the turbine flowmeter.

box 281 Replace the DBA control panel

DANGER OF FATAL ACCIDENT 14 due to electric shock

 Take the boiler out of operation and remove the DBA control panel, see box 43, 44, 47, 63 or 70.

 Disconnect the five plugs (harness - item 1, JP1, JP2, JP4 and JP3) from the DBA control panel.

#### box 283

- Remove the DBA control panel.
- Fit the new DBA control panel, following the above procedure in reverse order.

#### CAUTION!

Please ensure that the new DBA control panel is fitted with the correct KIM (see box 284). The coloured stripe on the new KIM should match that of the old KIM. Otherwise, refit the old KIM to the new DBA control panel.

• Fit the casing and place the boiler into operation, see box 51, 54 or 55.

#### box 284 Check the EEPROM (KIM)

- Check the plug-and-socket connection on the EEPROM (KIM).
- box 285 Check the junction box 230V roomtemperature connection

- Remove the casing lock and lower the DBA.
- Remove the cover from the RTH converter/Junction box (item 1).
- Run the 230V power supply cable through the cable pipework.
- Connect the 230V cable to item 1. The switch live should be connected to terminal 1 and the Neutral to terminal 2 of the 230V connection (item 2).

We reserve the right to make technical modifications

box 286 Check the junction box – 0 Volt roomtemperature connection

- Remove the casing lock and lower the DBA, see box 285.
- Remove the cover from the RTH converter/junction box, see box 285, item 1.
- Run the volt free power supply cable through the cable pipework.
- Connect the volt free cable at position 1 and 2 of the volt free connection, see box 285, item 3.

We reserve the right to make technical modifications
