

Light oil / kerosene burner

One stage operation

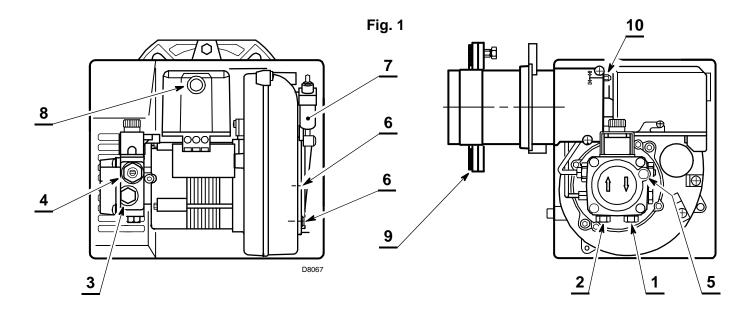

CODE	MODEL	TYPE
3744451	G 5	444T50

TECHNICAL DATA

Thermal power – output	28 – 60 kW – 2.3 – 5 kg/h
Fuel	Light oil 35s, max. viscosity at 20 °C: 6 mm ² /s Kerosene 28s
Electrical supply	Single phase, 230V ± 10% ~ 50Hz
Motor	Run current 0.85A - 2850 rpm - 298 rad/s
Capacitor	4 μF
Ignition transformer	Secondary 8 kV - 16 mA
Pump	Maximum pressure 14 bar (203 psi)
Absorbed electrical power	0.16 kW

- Burner with CE marking in conformity with EEC Directives: Electromagnetic Compatibility 2004/108/EC, Low Voltage 2006/95/EC, Machines 2006/42/EC.
- The burner meets protection level of IP 40, EN 60529.

- 1 Return line
- 2 Suction line
- 3 Gauge connection
- 4 Pump pressure regulator
- 5 Vacuum gauge connection
- 6 Screws fixing air-damper
- 7 Hydraulic jack with air-damper
- 8 Lock-out lamp and reset button
- 9 Flange with insulating gasket
- 10 Combustion head adjustment screw

HYDRAULIC JACK OPERATION 7)(Fig. 1)

It is strongly recommended a periodic check of the pump pressure operation (annually or better every six months, if the burner operation is continuous).

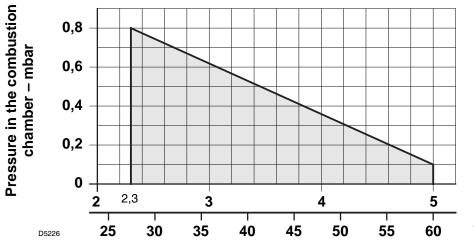

If the value is lower than 1 bar, compared to that one of the initial setting, please check the cleaning of the pump and line filters.

In case the pressure setting was not restorable, please replace the pump, in order to guarantee that the pump pressure during the prepurge time is at least 3.7 bar.

BURNER EQUIPMENT

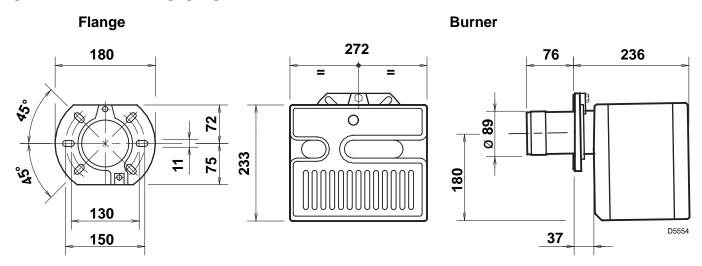

Quantity	Description
1	Flexible pipe with nipple
1	Flange with insulating gasket
2	Screws and nuts for flange
1	Maintenance assembly
1	Screw of pump by-pass
1	Grommet
1	Screw with two nuts for flange

FIRING RATE, (as EN 267)

Fuel output - kg/h
Thermal power - kW

OVERALL DIMENSIONS

INSTALLATION

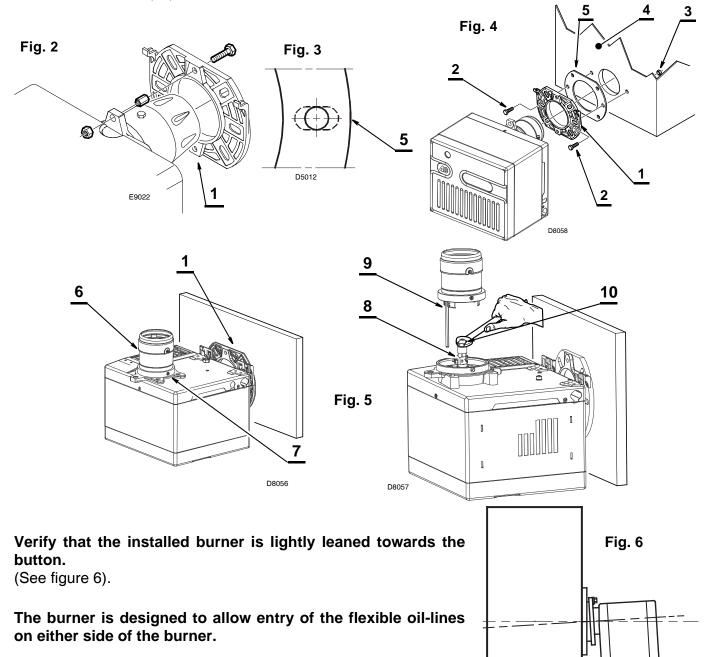

BOILER FIXING

- ➤ Put on the flange (1) the screw and two nuts, (see fig. 2).
- ➤ Widen, if necessary, the insulating gasket holes (5), (see fig. 3).
- ➤ Fix the flange (1) to the boiler door (4) using screws (2) and (if necessary) the nuts (3) **interposing the insulating gasket (5)**, (see fig. 4).

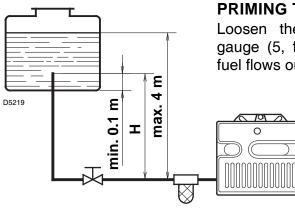

MAINTENANCE POSITION

Access to the combustion head, diffuser disc / electrodes unit and nozzle, (see fig. 5).

- ➤ Remove the burner out of the boiler, after loosing the fixing nut to the flange.
- ➤ Hook the burner to the flange (1), by removing the combustion head (6) after loosing the fixing screws (7).
- ➤ Remove the diffuser disc-holder assembly (9) from the nozzle-holder (8) after loosing its fixing screw.
- ➤ Screw the nozzle (10).

OIL LINES

PRIMING THE PUMP

Loosen the plug of the vacuum gauge (5, fig. 1) and wait until the fuel flows out.

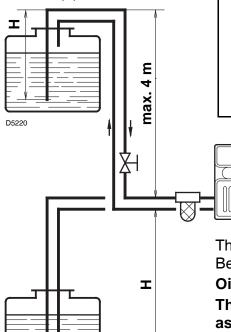

Н	L meters			
meters	I. D. 8 mm	I.D. 10 mm		
0.5	10	20		
1	20	40		
1.5	40	80		
2	60	100		

D5199

H = Difference of level.

L = Max. length of the suction line.

I.D.= Internal diameter of the oil pipes

н	L meters			
meters	I. D. 8 mm	I.D. 10 mm		
0	35	100		
0.5	30	100		
1	25	100		
1.5	20	90		
2	15	70		
3	8	30		
3.5	6	20		

a one pipe system. For use on a two pipe system, it is necessary to screw the **by-pass screw (A)** supplied as burner's accessory. (See figure).

The pump vacuum should not exceed a maximum of 0.4 bar (30 cm Hg). Beyond this limit gas is released from the oil.

Oil lines must be completely airtight.

The return line should terminate in the oil tank at the same level as the suction line; in this case a non-return valve is not required.

Should however the return line arrives over the fuel level, the non-return valve is indispensable.

This solution however is less safe than previous one, due to the possibility of leakage of the valve.

PRIMING THE PUMP:

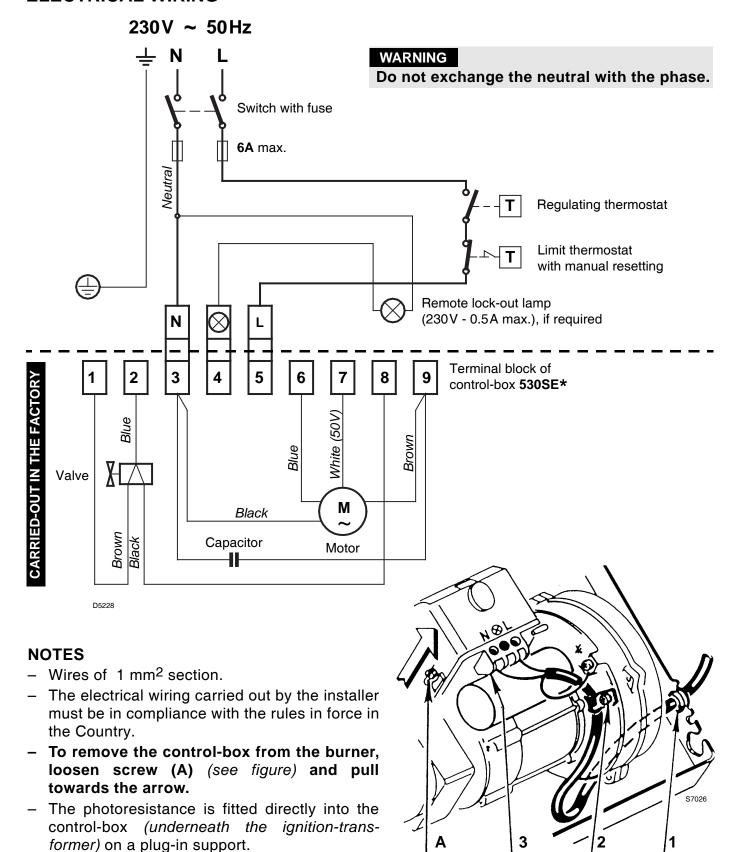

Start the burner and wait for the priming. Should lock-out occur prior to the arrival of the fuel, await at least 20 seconds before repeating the operation.

Warning: before starting the burner make sure that the return pipe-line is not clogged: any obstruction would cause the pump seals to break.

WARNING:

- ◆ Check periodically the flexible pipes conditions. Using kerosene, they have to be replaced at least every 2 years.
- ◆ A metal bowl filter with replaceable micronic filter must be fitted in the oil supply pipe.

ELECTRICAL WIRING

TESTING

Check the shut-down of the burner by opening the thermostats.

RUN OF THE ELECTRICAL CABLE

- 1 Cable gland2 Cable-clampN NeutralL Phase

COMBUSTION ADJUSTMENT

In conformity with Efficiency Directive 92/42/EEC the application of the burner on the boiler, adjustment and testing must be carried out observing the instruction manual of the boiler, including verification of the CO and CO_2 concentration in the flue gases, their temperatures and the average temperature of the water in the boiler. To suit the required appliance output, fit the nozzle then adjust the pump pressure, the setting of the combustion head and the air damper opening in accordance with the following schedule.

LIGHT OIL FUEL

	1	2		3	4
No	ozzle	Pump pressure	Burner output	Comb. head adjustment	Air damper adjustment
GPH	Angle	bar	kg/h ± 4%	Set-point	Set-point
0.60	60°/80°	12	2.6	1.5	2
0.65	60°/80°	12	2.8	2	2.2
0.75	60°	12	3.2	2.5	2.5
0.85	60°	12	3.7	3	3
1.00	60°	12	4.3	4	4.5
1.10	60°	12	4.8	5	6
1.10	60°	13	5.0	6	7

KEROSENE FUEL

	1	2		3	4
No	zzle	Pump pressure	Burner output	Comb. head adjustment	Air damper adjustment
GPH	Angle	bar	kg/h ± 4%	Set-point	Set-point
0.75	60°	8	2.2	1	2
0.85	60°	8	2.5	1.5	2
1.00	60°	8	2.9	2	2.3
1.10	60°	8	3.2	2.5	2.5
1.25	60°	8	3.7	3	3
1.35	60°	8	4.0	4	4
1.50	60°	8	4.4	5	5
1.50	60°	10	5.0	6	7

1 NOZZLES RECOMMENDED: Monarch type R - NS ; Delavan type W -A - E

Steinen type Q - H ; Danfoss type B - H

Angle: 60° - in most cases.

80° - in case of flame detachment, during ignitions at low temperatures.

2 PRESSURE:

8 bar: the pump leaves the factory set at this value, which is suitable only for kerosene.

10 bar: maximum pressure for kerosene.

FOR LIGHT OIL INCREASE PRESSURE

12 bar: in most cases.

14 bar: improves flame retention; it is therefore suitable for ignitions at low temperatures.

3 COMBUSTION HEAD SETTING

This is done when fitting the nozzle, with the blast tube removed. It depends on the output of the burner and is carried out by rotating the regulating rod, till the terminal plane of the blast tube is level with the set-point, as indicated in the schedule.

In the sketch below, the combustion head is set for an output of 0.85 GPH at 12 bar (for light oil) or 1.25 GPH at 8 bar (for kerosene).

The shutter is level with set-point **3**, as required by the table at page 6.

Combustion head settings indicated in the schedule are valid for most cases.

The setting of the fan output according to the installation should normally be done only through the air damper. Should one subsequently want to retouch also the setting of the combustion head, with the burner running, operate on the rod (1) with a 6 mm spanner (2) as follows:

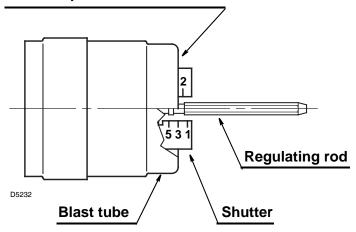

TURN TO THE RIGHT: (SIGN +)

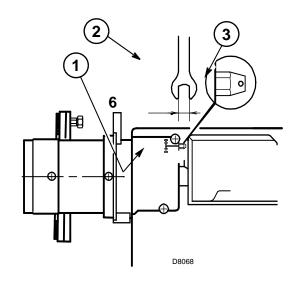

In order to increase the volume of air entering the combustion chamber and thus diminishing its pressure.

There is a reduction of CO₂ and the adhesion of the flame to the air diffuser disc improves.

(Setting advisable for ignitions at low temperatures).

Terminal plane of the blast tube

TURN TO THE LEFT: (SIGN -)

In order to reduce the volume of air entering the combustion chamber and thus increasing its pressure. The CO₂ improves and the adhesion of the flame to the diffuser tends to reduce. (This setting is not advisable for ignitions at low temperatures).

In any case do not bring the combustion head setting more than one point away from that indicated in the schedule. One set-point corresponds to 3 turns of the rod; a hole (3) at its end facilitates counting the number of turns.

4 AIR DAMPER ADJUSTMENT:

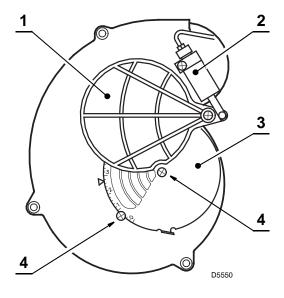

The mobile air damper (1) operated by the jack (2) assures the complete opening of the air intake.

The regulation of the air-rate is made by adjusting the fixed air damper (3), after loosing the screws (4). When the optimal regulation is reached, screw tight the screws (4) to assure a free movement of the mobile air damper (1).

The settings indicated in the schedule refer to the burner with its metal cover fitted and the combustion chamber with "zero" depression.

These regulations are purely indicative.

Each installation however, has its own unpredictable working conditions: actual nozzle output; positive or negative pressure in the combustion-chamber, the need of excess air, etc. All these conditions may require a different air-damper setting.

It is important to take account of the fact that the air output of the fan differs according to whether the burner has its metal cover fitted or not.

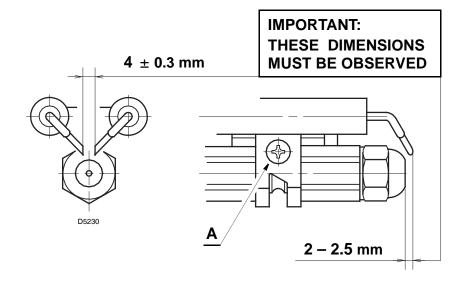

Therefore we recommended to proceed as follows:

- adjust the air damper as indicated in the schedule (4);
- mount the cover, simply by means of the upper screw;
- check smoke number;
- should it become necessary to modify the air output, remove the cover by loosening the screw,
 adjust the air damper, remount the cover and finally recheck the smoke number.

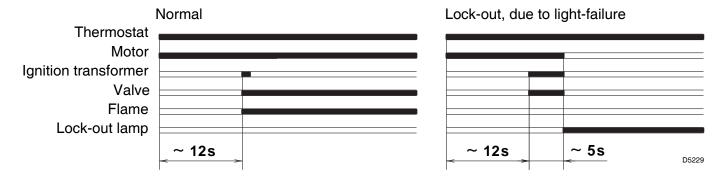

ELECTRODE SETTING

Attention:

Before removing or assembling the nozzle, loosen the screw (A) and move the electrodes ahead.

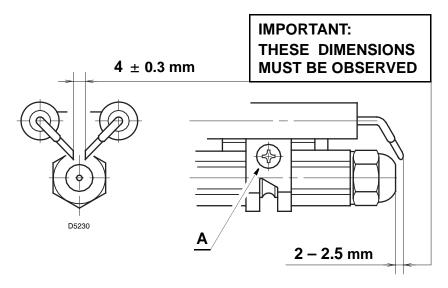

BURNER START-UP CYCLE

ONLY FOR LIGHT OIL ADJUSTMENTS, TO AVOID FLAME - DETACHMENT, AT BURNER - IGNITION

This inconvenience can occur, when the temperature of the light oil decreases below +8 °C.

1) CORRECT POSITIONING OF THE ELECTRODES

2) PUMP - SETTING

When the temperature of the light oil decreases below +8 °C, increase the pressure to 14 bar.

3) COMBUSTION-HEAD SETTING

Regulate the combustion-head one set-point further ahead than indicated in the instructions.

Example: the instructions require to set the combustion-head on set-point 3. Instead, the setting is made on set-point 4.

4) FAN - AIR DAMPER ADJUSTMENT

Adjust the damper, reducing the excess air until the Bacharach number is not near 1. (i.e. a combustion with the lowest possible excess-air).

SAFETY WARNINGS

The dimension of the boiler's combustion chamber must respond to specific values, in order to guarantee a combustion with the lowest polluting emissions rate.

The Technical Service Personnel will be glad to give you all the imformation for a correct matching of this burner to the boiler.

This burner must only be used for the application it was designed for.

The manufacturer accepts no liability within or without the contract for any damage caused to people, animals and property due to installation, adjustment and maintenance errors or to improper use.

BURNER IDENTIFICATION

The Identification Plate on the product gives the serial number, model and main technical and performance data.

If the Identification Plate is tampered with, removed or missing, the product cannot be clearly identified thus making any installation or maintenance work potentially dangerous.

BASIC SAFETY RULES

- ➤ Children or inexpert persons must not use the appliance.
- ➤ Under no circumstances must the intake grids, dissipation grids and ventilation vents in the installation room be covered up with cloths, paper or any other material.
- ➤ Unauthorised persons must not attempt to repair the appliance.
- ➤ It is dangerous to pull or twist the electric leads.
- ➤ Cleaning operations must not be performed if the appliance is not disconnected from the main power supply.
- ➤ Do not clean the burner or its parts with inflammable substances (e.g. petrol, alcohol, etc.). The cover must be cleaned with soapy water.
- ➤ Do not place anything on the burner.
- ➤ Do not block or reduce the size of the ventilation vents in the installation room.
- ➤ Do not leave containers and inflammable products in the installation room.
